

## SUMMARY OF PRODUCT CHARACTERISTICS

### 1. NAME OF THE MEDICINAL PRODUCT

VOPAZZI 400 mg Film Coated Tablets

### 2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each film coated tablet contains

**Active substance:**

Pazopanib hydrochloride 433.4 mg (equivalent to 400 mg pazopanib)

**Excipients:**

Sodium starch glycolate Type A ..... 42 mg

For a full list of excipients, see section 6.1.

### 3. PHARMACEUTICAL FORM

Film-coated tablets.

White, oval film-coated tablets.

### 4. CLINICAL PARTICULARS

#### 4.1 Therapeutic indications

- Pazopanib is indicated for use as a single agent until progression in patients with non-resectable local relapse or metastatic renal cell cancer who have not previously used any VEGF-TKI (Vascular endothelial growth factor-Tyrosine kinase inhibitor).
- VOPAZZI is indicated for the following subtypes of metastatic sarcoma that have undergone at least one series of chemotherapy/at most two series of chemotherapy for metastatic disease or have subsequently progressed:

Fibroblastic sarcomas (adult fibrosarcoma, myxofibrosarcoma, sclerosing epithelioid fibrosarcoma, malignant solitary fibrous tumor), fibrohistiocytic sarcomas (pleomorphic malignant fibrous histiocytoma, inflammatory malignant fibrous histiocytoma, giant cell malignant fibrous histiocytoma (also known as undifferentiated pleomorphic sarcoma [UPS]), leiomyosarcoma pleomorphic or alveolar rhabdomyosarcoma, epithelioid hemangioendothelioma, angiosarcomas, epithelioid sarcomas, synovial sarcoma, alveolar soft part sarcoma, malignant glomus tumor, clear cell sarcoma, desmoplastic small round cell sarcoma, malignant mesenchymoma, PEComa, intimal sarcoma, malignant peripheral nerve sheath tumors.

#### 4.2 Posology and method of administration

**Posology/Frequency and duration of administration**

VOPAZZI treatment should only be initiated by a physician experienced in the administration of anti-cancer medicinal products.

The recommended dose of pazopanib for the treatment of renal cell carcinoma (RCC) or soft tissue sarcoma (STS) is 800 mg taken once daily.

### Dose modifications

Dose modification (decrease or increase) to manage adverse reactions should be by gradual decrements or increments of 200 mg based on individual tolerability. The dose of pazopanib should not exceed 800 mg.

### **Method of administration**

Pazopanib is for oral use. Pazopanib should be taken without food (at least one hour before or two hours after a meal) (see section 5.2). The film-coated tablets should be taken whole with water and should not be broken or crushed (see section 5.2).

If a dose is missed and it is less than 12 hours before the next dose, the missed dose should not be taken.

### **Additional information on special populations**

#### **Renal impairment**

Renal impairment is unlikely to have a clinically relevant effect on pazopanib pharmacokinetics given the low renal excretion of pazopanib and metabolites (see section 5.2). Therefore, dosage adjustment is not necessary in patients with creatinine clearance above 30 mL/min. Caution is recommended in patients with creatinine clearance below 30 mL/min, as there is no experience with pazopanib in this patient population.

#### **Hepatic impairment**

Dosing recommendations in hepatically impaired patients are based on pharmacokinetic studies of pazopanib in patients with varying degrees of hepatic dysfunction (see section 5.2). All patients should have liver function tests to determine whether they have hepatic impairment before starting and during pazopanib therapy (see section 4.4). Pazopanib should be administered with caution to patients with mild to moderate hepatic impairment and tolerability should be closely monitored. In patients with mild abnormalities in liver function tests [defined either as normal bilirubin and any degree of alanine aminotransferase (ALT) elevation or as an elevation of bilirubin (>35% direct) up to 1.5 x upper limit of normal (ULN) regardless of the ALT value], it is recommended to initiate treatment with a dose of 800 mg pazopanib once daily. A reduced pazopanib dose of 200 mg once daily is recommended in patients with moderate hepatic impairment (defined as an elevation of bilirubin >1.5 to 3 x ULN regardless of the ALT value) (see section 5.2).

Pazopanib is not recommended in patients with severe hepatic impairment (defined as total bilirubin >3 x ULN, regardless of ALT).

See section 4.4 for liver monitoring and dose modification for patients with drug-induced hepatotoxicity.

#### **Pediatric population**

Pazopanib should not be used in children younger than 2 years of age because of safety concerns with regard to organ growth and maturation (see sections 4.4 and 5.3).

The safety and efficacy of pazopanib in children aged 2 to 18 years of age have not yet been established (see section 5.1).

Currently available data are explained in Sections 4.8, 5.1 and 5.2. However, no recommendation on

posology can be made.

### Geriatric population

There are limited data on the use of pazopanib in patients aged 65 years and older. In the clinical studies of pazopanib, overall no clinically significant differences in safety of pazopanib were observed between subjects aged at least 65 years and younger subjects. Clinical experience has not identified differences in responses between elderly and younger patients, but greater sensitivity of some elderly patients cannot be excluded.

### 4.3 Contraindications

VOPAZZI should not be used in patients with hypersensitivity to the active substance or any of the excipients and in patients with severe hepatic impairment.

It should not be used during pregnancy (see section 4.6).

It also should not be used in children under 2 years old.

### 4.4 Special warnings and precautions for use

#### Hepatic effects

Cases of hepatic failure (including fatalities) have been reported during use of pazopanib. Administration of pazopanib to patients with mild or moderate hepatic impairment should be undertaken with caution and close monitoring. 800 mg pazopanib once daily is the recommended dose in patients with mild abnormalities in serum liver tests (either normal bilirubin and any degree of ALT elevation or elevation of bilirubin up to 1.5 x ULN regardless of the ALT value). A reduced pazopanib dose of 200 mg once daily is recommended in patients with moderate hepatic impairment (elevation of bilirubin >1.5 to 3 x ULN regardless of the ALT value) (see sections 4.2 and 5.2). Pazopanib is not recommended in patients with severe hepatic impairment (total bilirubin >3 x ULN regardless of the ALT value) (see sections 4.2 and 5.2). Exposure at a 200 mg dose is markedly reduced, though highly variable, in these patients, with values considered insufficient to obtain a clinically relevant effect.

In clinical studies with pazopanib, increase in serum transaminases (ALT, aspartate aminotransferase [AST]) and bilirubin were observed (see section 4.8). In the majority of the cases, isolated increases in ALT and AST have been reported, without concomitant elevations of alkaline phosphatase or bilirubin. Patients over 60 years of age may be at greater risk for mild (>3 x ULN) to severe (>8 x ULN) elevation of ALT. Patients who carry the HLA-B\*57:01 allele have an increased risk of pazopanib-associated ALT elevations. Liver function should be monitored in all subjects receiving pazopanib, regardless of genotype or age (see section 5.1).

Serum liver tests should be performed before initiation of treatment with pazopanib, at weeks 3, 5, 7 and 9, then at months 3 and 4, with additional tests as clinically indicated. Periodic testing should then continue after month 4.

The guidelines in Table 1 are for patients with baseline total bilirubin values  $\leq 1.5$  x ULN and AST and ALT  $\leq 2$  x ULN.

#### **Table 1: Dose modifications for drug-induced hepatotoxicity**

Liver test values	Dose modification
Isolated increases in serum transaminase levels between 3 and 8 x ULN	Pazopanib treatment can be continued with weekly monitoring of liver function until serum transaminase values return to stage 1 or baseline levels.
Serum transaminase levels > 8 x ULN	Pazopanib treatment should be discontinued until serum transaminase values return to grade 1 or baseline. If the potential benefit of re-initiating pazopanib therapy is considered to outweigh the risk of hepatotoxicity, pazopanib therapy should be restarted at a lower dose of 400 mg daily and serum liver tests should be performed weekly for 8 weeks. If ALT values re-increase to > 3 x ULN following re-administration of pazopanib, pazopanib treatment should be permanently discontinued.
Serum transaminase levels increase to >3 x ULN and bilirubin levels increase to >2 x ULN	Pazopanib should be permanently discontinued. Patients should be monitored until recovery to stage 1 or baseline. Pazopanib is a uridine glucuronosyl transferase (UGT1A1) inhibitor. Mild, indirect (unconjugated) hyperbilirubinemia may occur in patients with Gilbert's syndrome. Patients with known or suspected Gilbert's syndrome, only mild indirect hyperbilirubinemia, and an increase in ALT >3 x ULN should be managed according to the recommendations for isolated ALT elevations.

Concomitant use of pazopanib and simvastatin increases the risk of ALT elevations (see section 4.5) and should be undertaken with caution and close monitoring.

#### Hypertension

In clinical studies with pazopanib, events of hypertension including newly diagnosed symptomatic episodes of elevated blood pressure (hypertensive crisis) have occurred. Blood pressure should be well controlled prior to initiating pazopanib. Patients should be monitored for hypertension early after starting treatment (no longer than one week after starting pazopanib) and frequently thereafter to ensure blood pressure control. Elevated blood pressure levels (systolic blood pressure  $\geq 150$  mm Hg or diastolic blood pressure  $\geq 100$  mm Hg) occurred early in the course of treatment (approximately 40% of cases occurred by day 9 and approximately 90% of cases occurred in the first 18 weeks). Blood pressure should be monitored and managed promptly using a combination of anti-hypertensive therapy and dose modification of pazopanib (interruption and re-initiation at a reduced dose based on clinical judgement) (see sections 4.2 and 4.8). Pazopanib should be discontinued if there is evidence of hypertensive crisis or if hypertension is severe and persists despite anti-hypertensive therapy and pazopanib dose reduction.

#### Posterior reversible encephalopathy syndrome (PRES)/Reversible posterior leukoencephalopathy syndrome (RPLS)

PRES/RPLS has been reported in association with pazopanib. PRES/RPLS can present with headache, hypertension, seizure, lethargy, confusion, blindness and other visual and neurological disturbances, and can be fatal. Patients developing PRES/RPLS should permanently discontinue treatment with pazopanib.

#### Interstitial lung disease (ILD)/Pneumonitis

ILD, which can be fatal, has been reported in association with pazopanib (see section 4.8). Patients should be monitored for pulmonary symptoms indicative of ILD/pneumonitis and pazopanib should be discontinued in patients developing ILD or pneumonitis.

#### Cardiac dysfunction/Heart failure

The risks and benefits of pazopanib should be considered before beginning therapy in patients who have pre-existing cardiac dysfunction. The safety and pharmacokinetics of pazopanib in patients with moderate to severe heart failure or those with a below normal left ventricular ejection fraction (LVEF) have not been studied.

In clinical studies with pazopanib, events of cardiac dysfunction such as congestive heart failure and decreased LVEF have occurred (see section 4.8). In a randomized study comparing pazopanib and sunitinib in RCC (VEG108844), subjects had baseline and follow up LVEF measurements. Myocardial dysfunction occurred in 13% (47/362) of subjects in the pazopanib arm compared to 11% (42/369) of subjects in the sunitinib arm. Congestive heart failure was observed in 0.5% of subjects in each treatment arm. Congestive heart failure was reported in 3 out of 240 subjects (1%) in the Phase III VEG110727 STS study. Decreases in LVEF in subjects who had post-baseline and follow-up LVEF measurement were detected in 11% (15/140) in the pazopanib arm, compared with 3% (1/39) in the placebo arm.

#### *Risk factors*

Thirteen of the 15 subjects in the pazopanib arm of the STS Phase III study had concurrent hypertension which may have exacerbated cardiac dysfunction in patients at risk by increasing cardiac after-load. Ninety-nine percent (99%) of patients (243/246) enrolled in the STS Phase III study, including the 15 subjects, received anthracycline. Prior anthracycline therapy may be a risk factor for cardiac dysfunction.

#### *Outcome*

Four of the 15 subjects had full recovery (within 5% of baseline) and 5 had partial recovery (within the normal range, but >5% below baseline). One subject did not recover and follow-up data were not available for the other 5 subjects.

#### *Management*

Interruption of pazopanib and/or dose reduction should be combined with treatment of hypertension (if present, refer to hypertension warning section above) in patients with significant reductions in LVEF, as clinically indicated.

Patients should be carefully monitored for clinical signs or symptoms of congestive heart failure. Baseline and periodic evaluation of LVEF is recommended in patients at risk of cardiac dysfunction.

#### QT prolongation and Torsade de Pointes

In clinical studies with pazopanib, events of QT prolongation and torsade de pointes have occurred (see section 4.8). Pazopanib should be used with caution in patients with a history of QT interval prolongation, in patients taking antiarrhythmics or other medicinal products that may prolong QT interval and in patients with relevant pre-existing cardiac disease. When using pazopanib, baseline and periodic monitoring of electrocardiograms and maintenance of electrolytes (e.g. calcium, magnesium, potassium) within normal range is recommended.

#### Arterial thrombotic events

In clinical studies with pazopanib, myocardial infarction, myocardial ischemia, ischemic stroke and transient ischemic attack were observed (see section 4.8). Fatal events have been observed. Pazopanib should be used with caution in patients who are at increased risk of thrombotic events or who have had a history of thrombotic events. Pazopanib has not been studied in patients who have had an event within the previous 6 months. A treatment decision should be made based on the assessment of individual patient's benefit/risk.

#### Venous thromboembolic events

In clinical studies with pazopanib, venous thromboembolic events including venous thrombosis and fatal pulmonary embolus have occurred. While observed in both RCC and STS studies, the incidence was higher in the STS population (5%) than in the RCC population (2%).

#### Thrombotic microangiopathy (TMA)

TMA has been reported in clinical studies of pazopanib as monotherapy, in combination with bevacizumab, and in combination with topotecan (see section 4.8). Patients developing TMA should permanently discontinue treatment with pazopanib. Reversal of effects of TMA has been observed after treatment was discontinued. Pazopanib is not indicated for use in combination with other agents.

#### Hemorrhagic events

In clinical studies with pazopanib hemorrhagic events have been reported (see section 4.8). Fatal hemorrhagic events have occurred. Pazopanib has not been studied in patients who had a history of hemoptysis, cerebral hemorrhage or clinically significant gastrointestinal (GI) hemorrhage in the past 6 months. Pazopanib should be used with caution in patients with significant risk of hemorrhage.

#### Aneurysms and artery dissections

The use of VEGF pathway inhibitors in patients with or without hypertension may promote the formation of aneurysms and/or artery dissections. Before initiating pazopanib, this risk should be carefully considered in patients with risk factors such as hypertension or history of aneurysms.

#### Gastrointestinal (GI) perforations and fistula

In clinical studies with pazopanib, events of GI perforation or fistula have occurred (see section 4.8). Fatal perforation events have occurred. Pazopanib should be used with caution in patients at risk for GI perforation or fistula.

#### Wound healing

No formal studies of the effect of pazopanib on wound healing have been conducted. Since vascular endothelial growth factor (VEGF) inhibitors may impair wound healing, treatment with pazopanib should be stopped at least 7 days prior to scheduled surgery. The decision to resume pazopanib after surgery should be based on clinical judgement of adequate wound healing. Pazopanib should be discontinued in patients with wound dehiscence.

#### Hypothyroidism

In clinical studies with pazopanib, events of hypothyroidism have occurred (see section 4.8). Baseline laboratory measurement of thyroid function is recommended and patients with hypothyroidism should be treated as per standard medical practice prior to the start of pazopanib treatment. All patients should be observed closely for signs and symptoms of thyroid dysfunction on pazopanib treatment. Laboratory monitoring of thyroid function should be performed periodically and managed

as per standard medical practice.

#### Proteinuria

In clinical studies with pazopanib, proteinuria has been reported. Baseline and periodic urinalysis during treatment is recommended and patients should be monitored for worsening proteinuria. Pazopanib should be discontinued if the patient develops nephrotic syndrome.

#### Tumor lysis syndrome (TLS)

The occurrence of TLS, including fatal TLS, has been associated with the use of pazopanib (see section 4.8). Patients at increased risk of TLS are those with rapidly growing tumors, a high tumor burden, renal dysfunction, or dehydration. Preventative measures, such as treatment of high uric acid levels and intravenous hydration, should be considered prior to initiation of VOPAZZI. Patients at risk should be closely monitored and treated as clinically indicated.

#### Pneumothorax

In clinical studies with pazopanib in advanced soft tissue sarcoma, events of pneumothorax have occurred (see section 4.8). Patients on pazopanib treatment should be observed closely for signs and symptoms of pneumothorax.

#### Pediatric population

Because the mechanism of action of pazopanib can severely affect organ growth and maturation during early post-natal development (see section 5.3) in rodents, pazopanib should not be given to pediatric patients younger than 2 years of age.

#### Infections

Cases of serious infections (with or without neutropenia), in some cases with fatal outcome, have been reported.

#### Combination with other systemic anti-cancer therapies

Clinical studies using pazopanib in combination with a number of other anti-cancer treatments (including, for example, pemetrexed, lapatinib or pembrolizumab) were terminated early due to concerns about increased toxicity and/or mortality, and a safe and effective combination dose with these regimens has not been established.

#### Pregnancy

Pre-clinical studies in animals have shown reproductive toxicity (see section 5.3). If pazopanib is used during pregnancy, or if the patient becomes pregnant whilst receiving pazopanib, the potential hazard to the fetus should be explained to the patient. Women of childbearing potential should be advised to avoid becoming pregnant while receiving treatment with pazopanib (see section 4.6).

#### Interactions

Concomitant treatment with strong inhibitors such as cytochrome P450(CYP)3A4, breast cancer resistance protein (BCRP) or P-glycoprotein (P-gp) should be avoided due to risk of increased exposure to pazopanib (see section 4.5). Selection of alternative concomitant medicinal products with no or minimal potential to inhibit CYP3A4, P-gp or BCRP should be considered.

Concomitant treatment with inducers of CYP3A4 should be avoided due to risk of decreased exposure to pazopanib (see section 4.5).

Cases of hyperglycemia have been observed during concomitant treatment with ketoconazole.

Concomitant administration of pazopanib with uridine diphosphate glucuronosyl transferase 1A1 (UGT1A1) substrates (e.g. irinotecan) should be undertaken with caution since pazopanib is an inhibitor of UGT1A1 (see section 4.5).

Grapefruit juice should be avoided during treatment with pazopanib (see section 4.5).

Excipients:

This medicinal product contains less than 1 mmol (23 mg) of sodium per film-coated tablet, i.e., essentially "sodium-free."

#### **4.5 Interactions with other medicinal products and other forms of interaction**

##### Effects of other medicinal products on pazopanib

*In vitro* studies suggested that the oxidative metabolism of pazopanib in human liver microsomes is mediated primarily by CYP3A4, with minor contributions from CYP1A2 and CYP2C8. Therefore, inhibitors and inducers of CYP3A4 may alter the metabolism of pazopanib.

##### CYP3A4, P-gp, BCRP inhibitors

Pazopanib is a substrate for CYP3A4, P-gp and BCRP.

Concurrent administration of pazopanib (400 mg once daily) with the strong CYP3A4 and P-gp inhibitor ketoconazole (400 mg once daily) for 5 consecutive days resulted in a 66% and 45% increase in mean pazopanib  $AUC_{(0-24)}$  and  $C_{max}$ , respectively, relative to administration of pazopanib alone (400 mg once daily for 7 days). Pharmacokinetic parameter comparisons of pazopanib  $C_{max}$  (range of means 27.5 to 58.1 microgram/mL) and  $AUC_{(0-24)}$  (range of means 48.7 to 1040 microgram\*hour/mL) after administration of pazopanib 800 mg alone and after administration of pazopanib 400 mg plus ketoconazole 400 mg (mean  $C_{max}$  59.2 microgram/mL, mean  $AUC_{(0-24)}$  1300 microgram\*hour/mL) indicated that, in the presence of a strong CYP3A4 and P-gp inhibitor a dose reduction to pazopanib 400 mg once daily will, in the majority of patients, result in systemic exposure similar to that observed after administration of 800 mg pazopanib once daily alone. Some patients however may have systemic pazopanib exposure greater than what has been observed after administration of 800 mg pazopanib alone.

Co-administration of pazopanib with other strong inhibitors of the CYP3A4 family (e.g. itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole) may increase pazopanib concentrations. Grapefruit juice contains an inhibitor of CYP3A4 and may also increase plasma concentrations of pazopanib.

Administration of 1500 mg lapatinib (a substrate for and weak inhibitor of CYP3A4 and P-gp and a potent inhibitor of BCRP) with 800 mg pazopanib resulted in an approximately 50% to 60% increase in mean pazopanib  $AUC_{(0-24)}$  and  $C_{max}$  compared to administration of 800 mg pazopanib alone. Inhibition of P-gp and/or BCRP by lapatinib likely contributed to the increased exposure to pazopanib.

Co-administration of pazopanib with a CYP3A4, P-gp, and BCRP inhibitor, such as lapatinib, will result in an increase in plasma pazopanib concentrations. Co-administration with potent P-gp or BCRP inhibitors may also alter the exposure and distribution of pazopanib, including distribution into the central nervous systems (CNS).

Concomitant use of pazopanib with a strong CYP3A4 inhibitor should be avoided (see section 4.4). If no medically acceptable alternative to a strong CYP3A4 inhibitor is available, the dose of pazopanib should be reduced to 400 mg daily during concomitant administration. In such cases there should be close attention to adverse drug reaction, and further dose reduction may be considered if possible drug-related adverse events are observed.

Combination with strong P-gp or BCRP inhibitors should be avoided, or selection of an alternate concomitant medicinal product with no or minimal potential to inhibit P-gp or BCRP is recommended.

#### *CYP3A4, P-gp, BCRP inducers*

CYP3A4 inducers such as rifampin may decrease plasma pazopanib concentrations. Co-administration of pazopanib with potent P-gp or BCRP inducers may alter the exposure and distribution of pazopanib, including distribution into the CNS. Selection of an alternative concomitant medication with no or minimal enzyme or transporter induction potential is recommended.

#### Effects of pazopanib on other medicinal products

*In vitro* studies with human liver microsomes showed that pazopanib inhibited CYP enzymes 1A2, 3A4, 2B6, 2C8, 2C9, 2C19, and 2E1. Potential induction of human CYP3A4 was demonstrated in an *in vitro* human Pregnane X Receptor (PXR) assay. Clinical pharmacology studies, using pazopanib 800 mg once daily, have demonstrated that pazopanib does not have a clinically relevant effect on the pharmacokinetics of caffeine (CYP1A2 probe substrate), warfarin (CYP2C9 probe substrate), or omeprazole (CYP2C19 probe substrate) in cancer patients. Pazopanib resulted in an increase of approximately 30% in the mean AUC and  $C_{max}$  of midazolam (CYP3A4 probe substrate) and increases of 33% to 64% in the ratio of dextromethorphan to dextrophan concentrations in the urine after oral administration of dextromethorphan (CYP2D6 probe substrate). Co-administration of pazopanib 800 mg once daily and paclitaxel 80 mg/m<sup>2</sup> (CYP3A4 and CYP2C8 substrate) once weekly resulted in a mean increase of 26% and 31% in paclitaxel AUC and  $C_{max}$ , respectively.

Based on *in vitro* IC<sub>50</sub> and *in vivo* plasma  $C_{max}$  values, pazopanib metabolites GSK1268992 and GSK1268997 may contribute to the net inhibitory effect of pazopanib towards BCRP. Furthermore, inhibition of BCRP and P-gp by pazopanib in the gastrointestinal tract cannot be excluded. Care should be taken when pazopanib is co-administered with other oral BCRP and P-gp substrates.

*In vitro*, pazopanib inhibited human organic anion transporting polypeptide (OATP1B1). It cannot be excluded that pazopanib will affect the pharmacokinetics of substrates of OATP1B1 (e.g. statins, see “Effect of concomitant use of pazopanib and simvastatin” below).

Pazopanib is an inhibitor of the uridine diphosphoglucuronosyl-transferase 1A1 (UGT1A1) enzyme *in vitro*. The active metabolite of irinotecan, SN-38, is a substrate for OATP1B1 and UGT1A1. Co-administration of pazopanib 400 mg once daily with cetuximab 250 mg/m<sup>2</sup> and irinotecan 150 mg/m<sup>2</sup> resulted in an approximately 20% increase in systemic exposure to SN-38. Pazopanib may have a greater impact on SN-38 disposition in subjects with the UGT1A1\*28 polymorphism relative to subjects with the wild-type allele. However, the UGT1A1 genotype was not always predictive of the effect of pazopanib on SN-38 disposition. Care should be taken when pazopanib is co-administered with substrates of UGT1A1.

#### Effect of concomitant use of pazopanib and simvastatin

Concomitant use of pazopanib and simvastatin increases the incidence of ALT elevations. Results

from a meta-analysis using pooled data from clinical studies with pazopanib show that ALT >3x ULN was reported in 126/895 (14%) of patients who did not use statins, compared with 11/41 (27%) of patients who had concomitant use of simvastatin ( $p = 0.038$ ). If a patient receiving concomitant simvastatin develops ALT elevations, follow guidelines for pazopanib posology and discontinue simvastatin (see section 4.4). In addition, concomitant use of pazopanib and other statins should be undertaken with caution as there are insufficient data available to assess their impact on ALT levels. It cannot be excluded that pazopanib will affect the pharmacokinetics of other statins (e.g. atorvastatin, fluvastatin, pravastatin, rosuvastatin).

#### Use with food and drink

Administration of pazopanib with a high-fat or low-fat meal results in an approximately 2-fold increase in AUC and  $C_{max}$ . Therefore, pazopanib should be administered at least 1 hour before or 2 hours after a meal.

#### Medicinal products that raise gastric pH

Concomitant administration of pazopanib with esomeprazole decreases the bioavailability of pazopanib by approximately 40% (AUC and  $C_{max}$ ), and co-administration of pazopanib with medicines that increase gastric pH should be avoided. If the concomitant use of a proton-pump inhibitor (PPI) is medically necessary, it is recommended that the dose of pazopanib be taken without food once daily in the evening concomitantly with the PPI. If the concomitant administration of an H<sub>2</sub>-receptor antagonist is medically necessary, pazopanib should be taken without food at least 2 hours before or at least 10 hours after a dose of an H<sub>2</sub>-receptor antagonist. Pazopanib should be administered at least 1 hour before or 2 hours after administration of short-acting antacids. The recommendations for how PPIs and H<sub>2</sub>-receptor antagonists are co-administered are based on physiological considerations.

### **4.6 Fertility, pregnancy and lactation**

#### **General recommendation**

Pregnancy category is D.

#### **Women of child-bearing potential/Contraception**

Women of childbearing potential should be advised to use adequate contraception during treatment and for at least 2 weeks after the last dose of pazopanib and to avoid becoming pregnant while receiving treatment with pazopanib.

Male patients (including those who have had vasectomies) should use condoms during sexual intercourse while taking pazopanib and for at least 2 weeks after the last dose of pazopanib to avoid potential exposure to the medicinal product for pregnant partners and female partners of reproductive potential.

#### **Pregnancy**

There are no adequate data from the use of pazopanib in pregnant women. Studies in animals have shown reproductive toxicity (see section 5.3). The potential risk for humans is unknown.

VOPAZZI should not be used during pregnancy unless the clinical condition of the woman requires treatment with pazopanib. If pazopanib is used during pregnancy, or if the patient becomes pregnant while receiving pazopanib, the potential hazard to the fetus should be explained to the patient.

## Lactation

The safe use of pazopanib during breast-feeding has not been established. It is not known whether pazopanib or its metabolites are excreted in human milk. There are no animal data on the excretion of pazopanib in animal milk. A risk to the breast-fed child cannot be excluded. Breast-feeding should be discontinued during treatment with pazopanib.

## Fertility

Animal studies indicate that male and female fertility may be affected by treatment with pazopanib (see section 5.3).

### 4.7 Effects on ability to drive and use machinery

VOPAZZI has no or negligible influence on the ability to drive and use machines. A detrimental effect on such activities cannot be predicted from the pharmacology of pazopanib. The clinical status of the patient and the adverse event profile of pazopanib should be borne in mind when considering the patient's ability to perform tasks that require judgement, motor or cognitive skills. Patients should avoid driving or using machines if they feel dizzy, tired or weak.

### 4.8 Undesirable effects

Pooled data from the pivotal RCC study (VEG105192, n=290), the extension study (VEG107769, n=71), the supportive Phase II study (VEG102616, n=225) and the randomized, open-label, parallel group Phase III non-inferiority study (VEG108844, n=557) were evaluated in the overall evaluation of safety and tolerability of pazopanib (total n=1149) in subjects with RCC (see section 5.1).

Pooled data from the pivotal STS study (VEG110727, n=369) and the supportive Phase II study (VEG20002, n=142) was evaluated in the overall evaluation of safety and tolerability of pazopanib (total safety population n=382) in subjects with STS (see section 5.1).

The most important serious adverse reactions associated with pazopanib therapy identified in the RCC or STS studies were transient ischemic attack, ischemic stroke, myocardial ischemia, myocardial and cerebral infarction, cardiac dysfunction, gastrointestinal perforation and fistula, QT prolongation, Torsade de Pointes and pulmonary, gastrointestinal and cerebral hemorrhage, all adverse reactions being reported in <1% of treated patients. Other important serious adverse reactions identified in STS studies included venous thromboembolic events, left ventricular dysfunction and pneumothorax.

Fatal events that were considered possibly related to pazopanib included gastrointestinal hemorrhage, pulmonary hemorrhage/hemoptysis, abnormal hepatic function, intestinal perforation and ischemic stroke.

The most common adverse reactions (experienced by at least 10% of the patients) of any grade in the RCC and STS trials included: diarrhea, hair color change, skin hypopigmentation, exfoliative rash, hypertension, nausea, headache, fatigue, anorexia, vomiting, dysgeusia, stomatitis, weight decreased, pain, elevated alanine aminotransferase and elevated aspartate aminotransferase.

Adverse drug reactions, all grades, which were reported in RCC and STS subjects or during the post-marketing period are listed below by MedDRA body system organ class. The following convention has been utilized for the classification of frequency:

Very common ( $\geq 1/10$ ); common ( $\geq 1/100$  to  $< 1/10$ ); uncommon ( $\geq 1/1,000$  to  $< 1/100$ ); rare ( $\geq 1/10,000$  to  $< 1/1,000$ ); very rare ( $< 1/10,000$ ); and not known (cannot be estimated from the available data).

Categories have been assigned based on absolute frequencies in the clinical trial data. Post-marketing data on safety and tolerability across all pazopanib clinical studies and from spontaneous reports have also been evaluated. Within each system organ class, adverse reactions with the same frequency are presented in order of decreasing seriousness.

**Treatment-related adverse reactions reported in RCC studies (n = 1149) or during post-marketing period:**

**Infections and Infestations**

Common: Infections (with or without neutropenia)<sup>†</sup>

Uncommon: Gingival infection, infectious peritonitis

**(incl. cysts and polyps) Neoplasms benign and malignant**

Uncommon: Tumor pain

**Blood and lymphatic system disorders**

Common: Thrombocytopenia, neutropenia, leukopenia

Uncommon: Polycythemia

Rare: Thrombotic microangiopathy (including thrombotic thrombocytopenic purpura and hemolytic uremic syndrome)<sup>†</sup>

**Endocrine disorders**

Common: Hypothyroidism

**Metabolism and nutrition disorders**

Very common: Decreased appetite<sup>e</sup>

Common: Hypophosphatemia, dehydration,

Uncommon: Hypomagnesaemia

Not known: Tumor lysis syndrome\*

**Psychiatric disorders**

Common: Insomnia

**Nervous system disorders**

Very common: Dysgeusia<sup>e</sup>, headache

Common: Dizziness, lethargy, paresthesia, peripheral sensory neuropathy

Uncommon: Hypoesthesia, transient ischemic attack, somnolence, cerebrovascular accident, ischemic stroke

Rare: Posterior reversible encephalopathy / reversible posterior leukoencephalopathy syndrome<sup>†</sup>

**Eye disorders**

Common: Vision blurred

Uncommon: Retinal detachment<sup>†</sup>, retinal tear<sup>†</sup>, eyelash discoloration

**Cardiac disorders**

Uncommon: Bradycardia, myocardial infarction, cardiac dysfunction<sup>f</sup>, myocardial ischemia

**Vascular disorders**

Very common: Hypertension  
Common: Hot flush, venous thromboembolic event<sup>g</sup>, flushing  
Uncommon: Hypertensive crisis, hemorrhage,  
Rare: Aneurysms and artery dissections

#### **Respiratory, thoracic and mediastinal disorders**

Common: Epistaxis, dysphonia, dyspnea, hemoptysis  
Uncommon: Rhinorrhea, pulmonary hemorrhage, pneumothorax  
Rare: Interstitial lung disease/pneumonitis<sup>†</sup>

#### **Gastrointestinal disorders**

Very common: Diarrhea, nausea, vomiting, abdominal pain<sup>a</sup>  
Common: Stomatitis, dyspepsia, flatulence, abdominal distension, mouth ulceration, dry mouth  
Uncommon: Pancreatitis, rectal hemorrhage, hematochezia, gastrointestinal hemorrhage, melena, frequent bowel movements, anal hemorrhage, large intestine perforation, mouth hemorrhage, upper gastrointestinal hemorrhage, enterocutaneous fistula, hematemesis, hemorrhoidal hemorrhage, ileal perforation, esophageal hemorrhage, retroperitoneal hemorrhage

#### **Hepatobiliary disorders**

Common: Hyperbilirubinemia, hepatic function abnormal, hepatotoxicity  
Uncommon: Jaundice, drug induced liver injury, hepatic failure<sup>†</sup>

#### **Skin and subcutaneous disorders**

Very common: Hair color change, palmar-plantar erythrodysesthesia syndrome, alopecia, rash  
Common: Skin hypopigmentation, dry skin, pruritus, erythema, skin depigmentation, hyperhidrosis  
Uncommon: Nail disorders, skin exfoliation (peeling), photosensitivity reaction, rash erythematous, skin disorder, rash macular, rash pruritic, vesicular rash, generalized pruritus, generalized rash, papular rash, plantar erythema, skin ulcer<sup>†</sup>

#### **Musculoskeletal, connective tissue and bone disorders**

Common: Arthralgia, myalgia, muscle spasms  
Uncommon: Musculoskeletal pain

#### **Renal and urinary tract disorders**

Very common: Proteinuria  
Uncommon: Hemorrhage in urinary tract

#### **Reproductive system and breast disorders**

Uncommon: Menorrhagia, vaginal hemorrhage, metrorrhagia

#### **General disorders and administration site conditions**

Very common: Fatigue  
Common: Mucosal inflammation, asthenia, edema<sup>b</sup>, chest pain  
Uncommon: Chills, mucous membrane disorder,

#### **Investigations**

Very common: Alanine aminotransferase increased, aspartate aminotransferase increased  
Common: Weight decreased, blood bilirubin increased, blood creatinine increased, lipase increased, white blood cell count decreased<sup>d</sup>, blood thyroid stimulating hormone increased, amylase increased,

gamma-glutamyltransferase increased, blood pressure increased, blood urea increased, liver function test abnormal

Uncommon: Hepatic enzyme increased, blood glucose decreased, electrocardiogram QT prolonged, transaminase increased, thyroid function test abnormal, blood pressure diastolic increased, blood pressure systolic increased

Tabulated list of adverse reactions:

**Table 2. Treatment-related adverse reactions reported in RCC studies (n = 1149) or during post-marketing period**

System Class	Organ	Frequency (all grades)	Adverse reactions	All grades number (%)	Grade 3 number (%)	Grade 4 number (%)

† Treatment-related adverse reaction reported during post-marketing period (spontaneous case reports and serious adverse reactions from all pazopanib clinical studies).

\* Treatment-related adverse reaction reported only during the post-marketing period. Frequency cannot be estimated from the available data.

The following terms have been presented combined:

<sup>a</sup> Abdominal pain, abdominal pain upper and abdominal pain lower

<sup>b</sup> Edema, edema peripheral, eye edema, localized edema and face edema

<sup>c</sup> Dysgeusia, ageusia and hypogeusia

<sup>d</sup> White cell count decreased, neutrophil count decreased and leukocyte count decreased

<sup>e</sup> Decreased appetite and anorexia

<sup>f</sup> Cardiac dysfunction, left ventricular dysfunction, cardiac failure and restrictive cardiomyopathy

<sup>g</sup> Venous thromboembolic event, deep vein thrombosis, pulmonary embolism and thrombosis

Neutropenia, thrombocytopenia and palmar-plantar erythrodysesthesia syndrome were observed more frequently in patients of East Asian descent.

### **Treatment-related adverse reactions reported in STS studies (n=382) or during post-marketing period**

#### **Infections and infestations**

Common: Gingival infection

**(incl. cysts and polyps) Neoplasms benign and malignant**

Very common: Tumor pain

**Blood and lymphatic system disorders<sup>f</sup>**

Very common: Leukopenia, thrombocytopenia, neutropenia

Uncommon: Thrombotic microangiopathy (including thrombotic thrombocytopenic purpura and hemolytic uremic syndrome)

**Endocrine disorders**

Common: Hypothyroidism

**Metabolism and nutrition disorders**

Very common: Decreased appetite, hypoalbuminemia<sup>f</sup>

Common: Dehydration

Uncommon: Hypomagnesaemia

Not known: Tumor lysis syndrome\*

**Psychiatric disorders**

Common: Insomnia

**Nervous system disorders**

Very common: Impaired sense of taste<sup>c</sup>, headache

Common: Peripheral sensory neuropathy, dizziness

Uncommon: Somnolence, paresthesia, cerebral infarction

**Eye disorders**

Common: Vision blurred

**Cardiac disorders**

Common: Cardiac dysfunction<sup>g</sup>, left ventricular dysfunction, bradycardia

Uncommon: Myocardial infarction

**Vascular disorders**

Very common: Hypertension

Common: Venous thromboembolic event<sup>d</sup>, hot flush, flushing

Uncommon: Hemorrhage

Not known: Aneurysms and artery dissections

**Respiratory, thoracic and mediastinal disorders**

Common: Epistaxis, dysphonia, dyspnea, cough, pneumothorax, hiccups, pulmonary hemorrhage

Uncommon: Oropharyngeal pain, bronchial hemorrhage, rhinorrhea, hemoptysis

Rare: Interstitial lung disease/pneumonitis<sup>††</sup>

**Gastrointestinal disorders**

Very common: Diarrhea, nausea, vomiting, abdominal pain<sup>a</sup>, stomatitis

Common: Abdominal distension, dry mouth, dyspepsia, mouth hemorrhage, flatulence, anal hemorrhage

Uncommon: Gastrointestinal hemorrhage, rectal hemorrhage, enterocutaneous fistula, gastric hemorrhage, melena, esophageal hemorrhage, peritonitis, retroperitoneal hemorrhage, upper gastrointestinal hemorrhage, ileum perforation

**Hepatobiliary disorders**

Uncommon: Hepatic function abnormal  
Not known: Hepatic failure\*

**Skin and subcutaneous tissue disorders**

Very common: Hair color change, skin hypopigmentation, exfoliative rash  
Common: Alopecia, skin disorder<sup>c</sup>, dry skin, hyperhidrosis, nail disorder, pruritus, erythema  
Uncommon: Skin ulcer, rash, rash popular, photosensitivity reaction, palmar-plantar erythrodysesthesia syndrome

**Musculoskeletal, connective tissue and bone disorders**

Common: Musculoskeletal pain, myalgia, muscle spasms  
Uncommon: Arthralgia

**Renal and urinary tract disorders**

Uncommon: Proteinuria

**Reproductive system and breast disorder**

Uncommon: Vaginal hemorrhage, menorrhagia

**General disorders and administration site conditions**

Very common: Fatigue  
Common: Edema<sup>b</sup>, chest pain, chills  
Uncommon: Mucosal inflammation<sup>e</sup>, asthenia

**Investigations<sup>h</sup>**

Very common: Weight decreased  
Common: Ear, nose and throat examination abnormal<sup>e</sup>, alanine aminotransferase increased, blood cholesterol abnormal, aspartate aminotransferase increased, gamma glutamyltransferase increased  
Uncommon: Blood bilirubin increased, aspartate aminotransferase, alanine aminotransferase, platelet count decreased, electrocardiogram QT prolonged

†Treatment-related adverse reaction reported during post-marketing period (spontaneous case reports and serious adverse reactions from all pazopanib clinical studies).

\*Treatment-related adverse reaction reported only during the post-marketing period. Frequency cannot be estimated from the available data.

The following terms have been combined:

<sup>a</sup> Abdominal pain, abdominal pain upper and gastrointestinal pain

<sup>b</sup> Edema, edema peripheral and eyelid edema

<sup>c</sup> The majority of these cases were Palmar-plantar erythrodysesthesia syndrome

<sup>d</sup> Venous thromboembolic events – includes Deep vein thrombosis, Pulmonary embolism and Thrombosis terms

<sup>e</sup> The majority of these cases describe mucositis

<sup>f</sup> Frequency is based on laboratory value tables from VEG110727 (N=240). These were reported as adverse events less frequently by investigators than as indicated by laboratory value tables.

<sup>g</sup> Cardiac dysfunction events – includes Left ventricular dysfunction, Cardiac failure and Restrictive cardiomyopathy terms

<sup>h</sup> Frequency is based on adverse events reported by investigators. Laboratory abnormalities were reported as adverse events less frequently by investigators than as indicated by laboratory value tables.

Neutropenia, thrombocytopenia and palmar-plantar erythrodysesthesia syndrome were observed more frequently in patients of East Asian descent.

#### Pediatric population

The safety profile in pediatric patients was similar to that reported with pazopanib in adults in the approved indications based on data from 44 pediatric patients from Phase I study ADVL0815 and 57 pediatric patients from Phase II study PZP034X2203 (see section 5.1).

#### Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorization of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions in accordance with local requirements.

#### **4.9 Overdose**

Pazopanib doses up to 2000 mg have been evaluated in clinical studies. Grade 3 fatigue (dose-limiting toxicity) and Grade 3 hypertension were each observed in 1 of 3 patients dosed at 2000 mg and 1000 mg daily, respectively.

#### Treatment

There is no specific antidote for overdose with pazopanib and cases of overdose should be treated with general supportive measures.

### **5. PHARMACOLOGICAL PROPERTIES**

#### **5.1. Pharmacodynamic properties**

Pharmacotherapeutic group: Antineoplastic and immunomodulatory agents, antineoplastic agents, protein-kinase inhibitors; other protein kinase inhibitors.

ATC code: L01EX03

#### Mechanism of action

Pazopanib is a potent multitarget tyrosine kinase inhibitor (TKI) of Vascular Endothelial Growth Factor Receptors (VEGFR)-1, -2 and -3, platelet-derived growth factor (PDGFR)- $\alpha$  and - $\beta$  and stem cell factor receptor (c-KIT) with IC<sub>50</sub> values of 10, 30, 47, 71, 84 and 74 nanomolar, respectively, for oral administration. In preclinical experiments, pazopanib dose-dependently inhibited ligand-induced auto-phosphorylation of VEGFR-2, c-Kit and PDGFR- $\beta$  receptors in cells. *In vivo*, pazopanib inhibited VEGF-induced VEGFR-2 phosphorylation in mouse lungs, angiogenesis in various animal models, and the growth of multiple human tumor xenografts in mice.

### Pharmacogenomics

In a pharmacogenetic meta-analysis of data from 31 clinical studies of pazopanib administered either as monotherapy or in combination with other agents, ALT >5 x ULN (NCI CTC Grade 3) observed as in 19% of HLA-B\*57:01 allele carriers and in 10% of non-carriers. In this dataset, 133/2235 (6%) of the patients carried the HLA-B\*57:01 allele (see section 4.4).

### Clinical studies

#### Renal cell carcinoma (RCC)

The safety and efficacy of pazopanib in renal carcinoma (RCC) were evaluated in a randomized, double-blind, placebo-controlled multicenter study. Patients (N = 435) with locally advanced and/or metastatic RCC were randomized to receive pazopanib 800 mg once daily or placebo. The primary objective of the study was to evaluate and compare the two treatment arms for progression-free survival (PFS) and the principle secondary endpoint was decided as overall survival (OS). The other objectives were to evaluate the overall response rate and duration of response.

From the total of 435 patients in this study, 233 patients were treatment-naive and 202 were second-line patients who had received one prior IL-2 or INF $\alpha$ -based therapy. The performance status (ECOG) was similar between the pazopanib and placebo groups (ECOG 0: 42% vs. 41%, ECOG 1: 58% vs. 59%). The majority of patients had either favorable (39%) or intermediate (54%), MSKCC (Memorial Sloan Kettering Cancer Centre) / Motzer prognostic factors. All patients had clear cell histology or predominantly clear cell histology. Approximately half of all patients had 3 or more organs involved in their disease and most patients had the lung (74%), and/or lymph nodes (54%) as a metastatic location for disease at baseline.

A similar proportion of patients in each arm were treatment-naive or cytokine pre-treated (53% and 47% in pazopanib arm, 54% and 46% in placebo arm). In the cytokine pre-treated subgroup, the majority of patients (75%) had received interferon-based treatment.

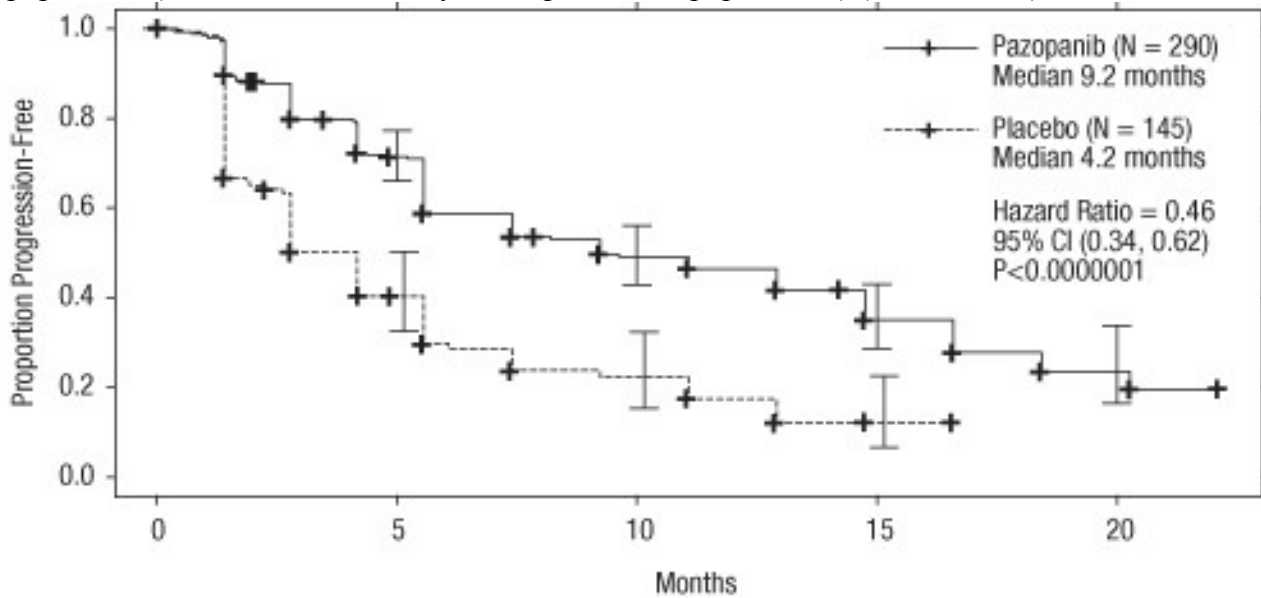

Similar proportions of patients in each arm had prior nephrectomy (89% and 88% in the pazopanib and placebo arms, respectively) and/or prior radiotherapy (22% and 15% in the pazopanib and placebo arms, respectively).

The primary analysis of the primary endpoint PFS is based on disease assessment by independent radiological review in the entire study population (treatment-naive or cytokine pre-treated).

Table 4. Overall efficacy results in RCC by independent assessment (VEG105192)

Endpoints/Study population	Pazopanib	Placebo	HR (95% CI)	P value (one-sided)
PFS				
Overall* ITT	N = 290	N = 145		
Median (months)	9.2	4.2	0.46 (0.34, 0.62)	<0.0000001
Response rate % (95% CI)	N = 290 30 (25.1,35.6)	N = 145 3 (0.5, 6.4)	–	<0.001
HR = hazard ratio; ITT = intent to treat; PFS = progression-free survival. * - treatment-naive and cytokine pre-treated populations, CI = Confidence Interval				

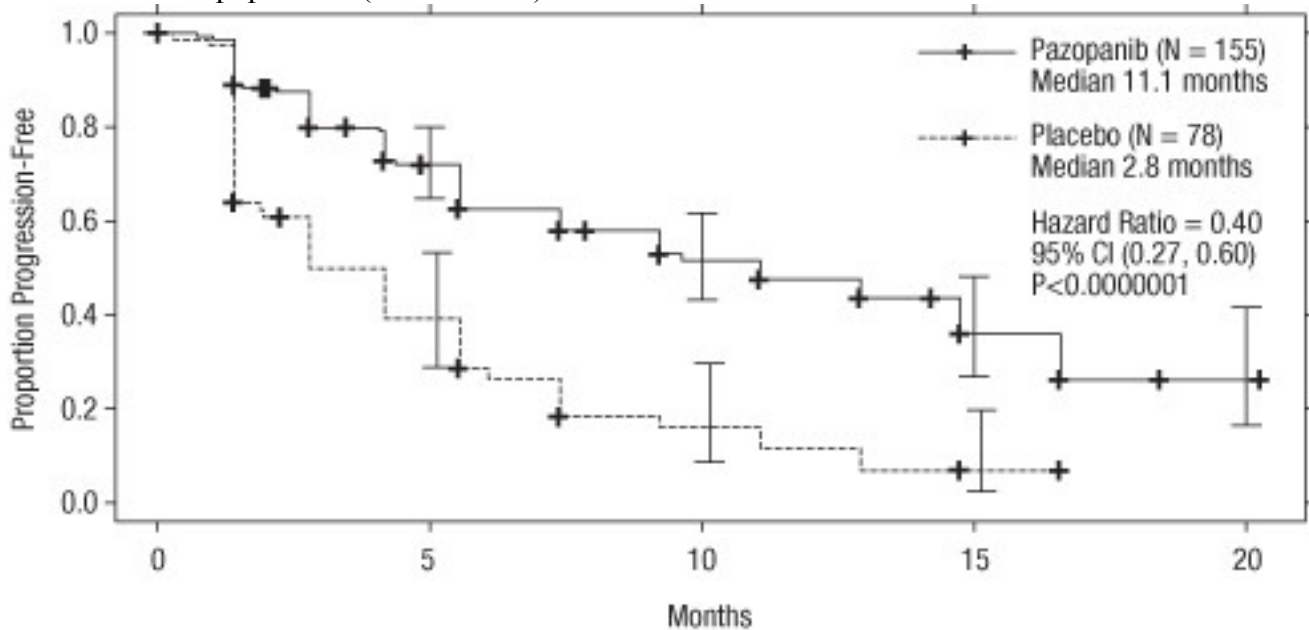

Figure 1. Kaplan-Meier curve for progression-free survival by independent assessment for the overall population (treatment-naive and cytokine pre-treated populations) (VEG105192)

x-axis; Months, y-axis; Rate Progression-Free, Pazopanib ----- (N = 290) Median 9.2 months; Placebo ----- (N = 145) Median 4.2 months; Hazard Ratio = 0.46, 95% CI (0.34; 0.62), P < 0.0000001

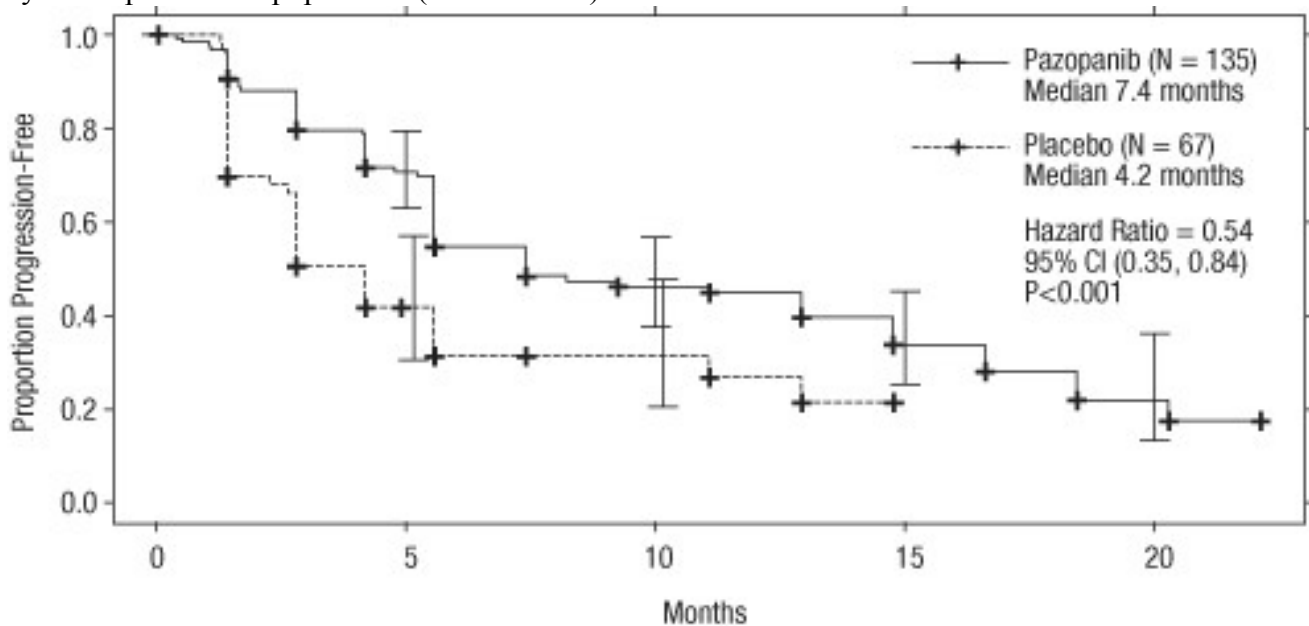

Figure 2. Kaplan-Meier curve for progression-free survival by independent assessment for the

treatment-naive population (VEG105192)

x-axis; Months, y-axis; Rate Progression-Free, Pazopanib (N = 155) Median 11.1 months; Placebo (N = 78) Median 2.8 months; Hazard Ratio = 0.4, 95% CI (0.27, 0.6), P < 0.0000001

Figure 3. Kaplan-Meier Curve for progression-free survival by independent assessment for the cytokine pre-treated population (VEG105192)

x-axis; Months, y-axis; Rate Progression-Free, Pazopanib (N = 135) Median 7.4 months; Placebo (N = 67) Median 4.2 months; Hazard Ratio = 0.54, 95% CI (0.35, 0.84), P < 0.001

For patients who responded to treatment, the median time to response was 11.9 weeks and the median duration of response was 58.7 weeks as per independent review (VEG105192).

The median overall survival (OS) data at the protocol-specified final survival analysis were 22.9 months and 20.5 months [HR = 0.91 (95% CI: 0.71, 1.16; p = 0.224)] for patients randomized to the

pazopanib and placebo arms, respectively. The OS results are subject to potential bias as 54% of patients in the placebo arm also received pazopanib in the extension part of this study following disease progression. Sixty-six (66%) percent of placebo patients received post-study therapy compared to 30% of pazopanib patients.

No statistical differences were observed between treatment groups for Global Quality of Life using EORTC QLQ-C30 and EuroQoL EQ-5D.

In a Phase II study of 225 patients with locally recurrent or metastatic clear cell renal cell carcinoma, objective response rate was 35% and median duration of response was 68 weeks, as per independent review. Median PFS was 11.9 months.

The safety, efficacy and quality of life of pazopanib versus sunitinib was evaluated in a randomized, open-label, parallel group Phase III non-inferiority study (VEG108844).

In VEG108844, patients (N = 1110) with locally advanced and/or metastatic RCC who had not received prior systemic therapy, were randomized to receive either pazopanib 800 mg once daily continuously or sunitinib 50 mg once daily in 6-week cycles of dosing with 4 weeks on treatment followed by 2 weeks without treatment.

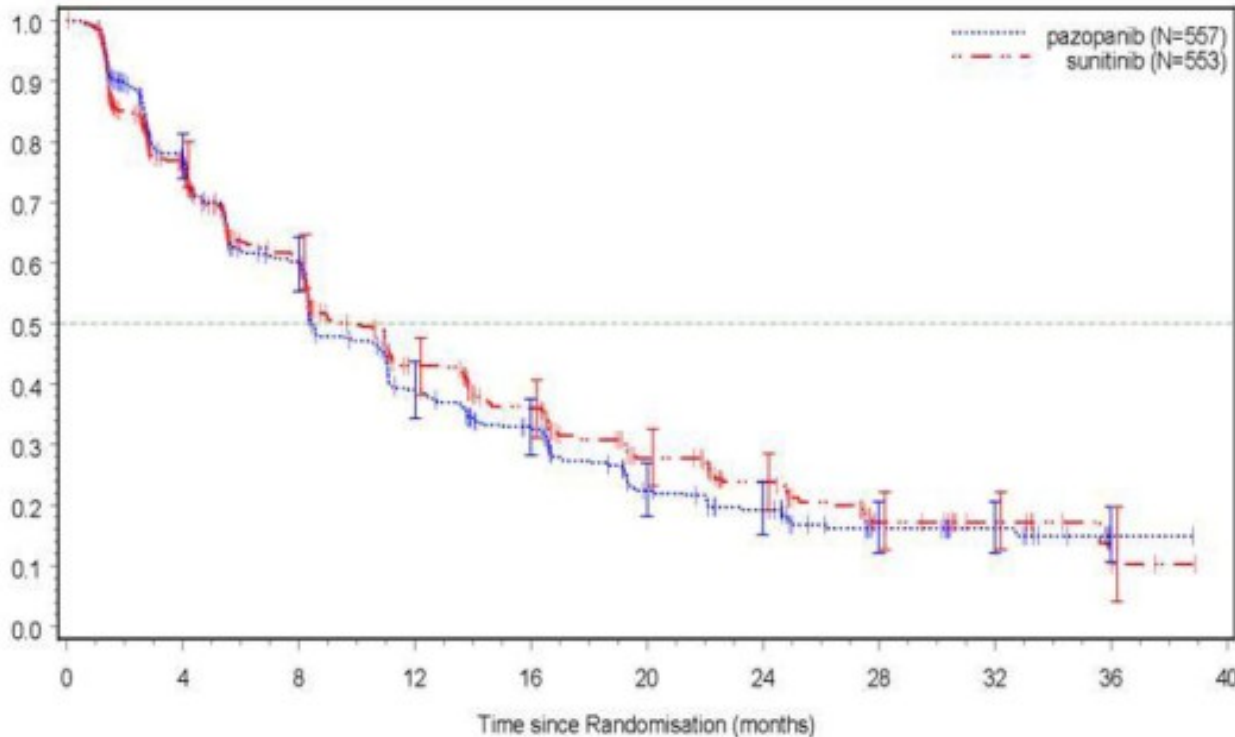

The primary objective of this study was to evaluate and compare PFS in patients treated with pazopanib to those treated with sunitinib. Demographic characteristics were similar between the treatment arms. Disease characteristics at initial diagnosis and at screening were balanced between the treatment arms with the majority of patients having clear cell histology and Stage IV disease.

VEG108844 achieved its primary endpoint of PFS and demonstrated that pazopanib was non-inferior to sunitinib, as the upper bound of the 95% CI for the hazard ratio was less than the protocol-specified non-inferiority margin of 1.25. Overall efficacy results are summarized in Table 5.

**Table 5. Overall efficacy results (VEG108844)**

<b>Endpoint</b>	<b>Pazopanib N = 557</b>	<b>Sunitinib N = 553</b>	<b>HR (95% CI)</b>
<b>PFS</b>			
Overall			
Median (months) (95% CI)	8.4 (8.3, 10.9)	9.5 (8.3, 11.0)	1.047 (0.898, 1.220)
<b>Overall Survival</b>			
Median (months) (95% CI)	28.3 (26.0, 35.5)	29.1 (25.4, 33.1)	0.915 <sup>a</sup> (0.786, 1.065)
HR = hazard ratio; PFS = progression-free survival based on independent review committee (IRC) evaluation; CI = Confidence Interval; <sup>a</sup> P value = 0.245 (2-sided)			

**Figure 4. Kaplan-Meier curve for progression-free survival by independent assessment for the overall population (VEG108844)**

Subgroup analyses of PFS were performed for 20 demographic and prognostic factors. The 95% confidence intervals for all subgroups include a hazard ratio of 1. In the three smallest of these 20 subgroups, the point estimate of the hazard ratio exceeded 1.25; i.e. in subjects with no prior nephrectomy (n=186, HR=1.403, 95% CI [0.955, 2.061]), baseline LDH>1.5 x ULN (n=68, HR=1.72, 95% CI [0.943, 3.139]), and MSKCC: poor risk (n=119, HR=1.472, 95% CI [0.937, 2.313]).

#### Soft-tissue sarcoma (STS)

The efficacy and safety of pazopanib in STS were evaluated in a pivotal Phase III randomized, double-blind, placebo-controlled multicenter study (VEG110727). A total of 369 patients with advanced STS were randomized to receive pazopanib 800 mg once daily or placebo. Importantly, only patients with selective histological subtypes of STS were allowed to participate to the study, therefore efficacy and safety of pazopanib can only be considered established for those subgroups of STS and treatment with pazopanib should be restricted to such STS subtypes.

#### *The following tumor types were eligible:*

Fibroblastic (adult fibrosarcoma, myxofibrosarcoma, sclerosing epithelioid fibrosarcoma, malignant solitary fibrous tumors), so-called fibrohistiocytic (pleomorphic malignant fibrous histiocytoma [MFH], giant cell MFH also known as undifferentiated pleomorphic sarcoma [UPS], inflammatory MFH), leiomyosarcoma, malignant glomus tumors, skeletal muscles (pleomorphic and alveolar rhabdomyosarcoma), vascular (epithelioid hemangioendothelioma, angiosarcoma), uncertain differentiation (synovial, epithelioid, alveolar soft part, clear cell, desmoplastic small round cell,

extra-renal rhabdoid, malignant mesenchymoma, PEComa, intimal sarcoma), malignant peripheral nerve sheath tumors, undifferentiated soft tissue sarcomas not otherwise specified (NOS) and other types of sarcoma (not listed as ineligible).

*The following tumor types were not eligible:*

Adipocytic sarcoma (all subtypes), all rhabdomyosarcoma that were not alveolar or pleomorphic, chondrosarcoma, osteosarcoma, Ewing tumors/primitive neuroectodermal tumors (PNET), GIST, dermatofibromatosis sarcoma protuberans, inflammatory myofibroblastic sarcoma, malignant mesothelioma and mixed mesodermal tumors of the uterus.

Of note, patients with adipocytic sarcoma were excluded from the pivotal Phase III study as in a preliminary Phase II study (VEG20002) activity (PFS at week 12) observed with pazopanib in adipocytic did not meet the prerequisite rate to allow further clinical testing.

Other key eligibility criteria of the VEG110727 study were: histological evidence of high or intermediate grade malignant STS and disease progression within 6 months of therapy for metastatic disease, or recurrence within 12 months of (neo)-/adjuvant therapy.

Ninety-eight percent (98%) of subjects received prior doxorubicin, 70% prior ifosfamide, and 65% of subjects had received at least three or more chemotherapeutic agents prior to study enrolment.

Patients were stratified by the factors of WHO performance status (WHO PS) (0 or 1) at baseline and the number of lines of prior systemic therapy for advanced disease (0 or 1 vs. 2+). In each treatment group, there was a slightly greater percentage of subjects in the 2+ lines of prior systemic therapy for advanced disease (58% and 55%, respectively, for placebo and pazopanib treatment arms) compared with 0 or 1 lines of prior systemic therapy (42% and 45%, respectively, for placebo and pazopanib treatment arms). The median duration of follow-up of subjects (defined as date of randomization to date of last contact or death) was similar for both treatment arms (9.36 months for placebo [range 0.69 to 23.0 months] and 10.04 months for pazopanib [range 0.2 to 24.3 months]).

The primary objective of the study was progression-free survival (PFS assessed by independent radiological review); the secondary endpoints included overall survival (OS), overall response rate and duration of response.

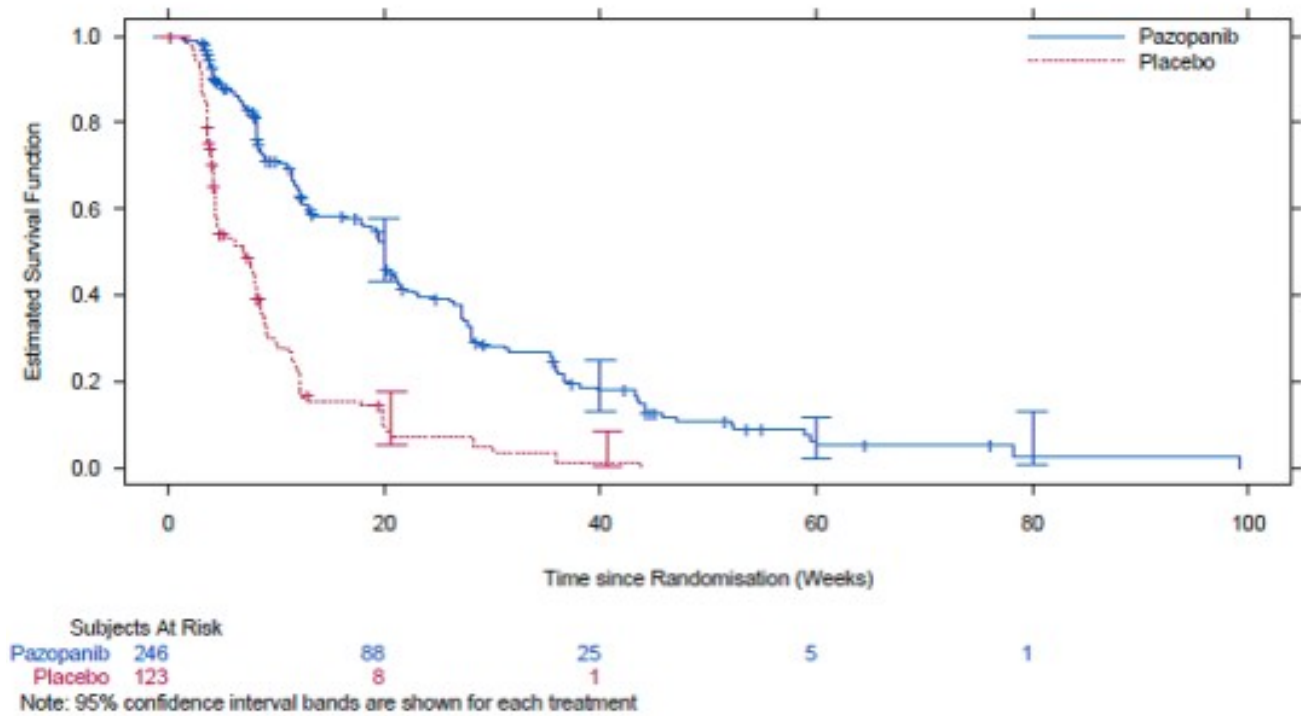

**Table 6. Overall efficacy results in STS by independent assessment (VEG110727)**

Endpoints / study population	Pazopanib	Placebo	HR (95% CI)	P value (two-sided)
<b>PFS</b>				
Overall ITT	N = 246	N = 123		
Median (weeks)	20.0	7.0	0.35 (0.26, 0.48)	<0.001
Leiomyosarcoma	N = 109	N = 49		
Median (weeks)	20.1	8.1	0.37 (0.23, 0.60)	<0.001
Synovial sarcoma subgroups	N = 25	N = 13		
Median (weeks)	17.9	4.1	0.43 (0.19, 0.98)	0.005
'Other STS' subgroups	N = 112	N = 61		
Median (weeks)	20.1	4.3	0.39 (0.25, 0.60)	<0.001

<b>OS</b>				
Overall ITT	N = 246	N = 123		
Median (months)	12.6	10.7	0.87 (0.67, 1.12)	0.256
Leiomyosarcoma*	N = 109	N = 49		
Median (months)	16.7	14.1	0.84 (0.56, 1.26)	0.363
Synovial sarcoma subgroups*	N = 25	N = 13		
Median (months)	8.7	21.6	1.62 (0.79, 3.33)	0.115
“Other STS” subgroups*	N = 112	N = 61		
Median (months)	10.3	9.5	0.84 (0.59, 1.21)	0.325
<b>Response rate (CR+PR)</b>				
% (95% CI)	4 (2.3, 7.9)	0 (0.0, 3.0)		
Duration of response				
Median (weeks) (95% CI)	38.9 (16.7, 40.0)			
HR = hazard ratio; ITT = intent to treat; PFS = progression-free survival; CR = complete response; PR = partial response. CI = confidence interval; OS = overall survival * Overall survival for the respective STS histological subgroups (leiomyosarcoma, synovial sarcoma and “Other” STS) should be interpreted with caution due to the small number of subjects and wide confidence intervals				

A similar improvement in PFS based on investigator assessments was observed in the pazopanib arm compared with the placebo arm (in the overall ITT population HR: 0.39; 95% CI, 0.3 to 0.52, p <0.001).

**Figure 5. Kaplan-Meier Curve for Progression-Free Survival in STS by Independent Assessment for the Overall Population (VEG110727)**

No significant difference in OS was observed between the two treatment arms at the final OS analysis performed after 76% (280/369) of the events had occurred (HR 0.87, 95% CI 0.67, 1.12 p=0.256).

### Pediatric population

A Phase I study (ADV0815) of pazopanib was conducted in 44 pediatric patients with various recurrent or refractory solid tumors. The primary objective was to investigate the maximum tolerated dose (MTD), the safety profile and the pharmacokinetic properties of pazopanib in children. The median duration of exposure in this study was 3 months (1-23 months).

A Phase II study (PZP034X2203) of pazopanib was conducted in 57 pediatric patients with refractory solid tumors including rhabdomyosarcoma (N=12), non-rhabdomyosarcoma soft tissue sarcoma (N=11), Ewing sarcoma/pPNET (N=10), osteosarcoma (N=10), neuroblastoma (N=8) and hepatoblastoma (N=6). The study was a single-agent, non-controlled, open-label study to determine the therapeutic activity of pazopanib in children and adolescents aged 1 to <18 years of age. Pazopanib was administered daily as a tablet at a dose of 450 mg/m<sup>2</sup>/dose or as an oral suspension at 225 mg/m<sup>2</sup>/dose. The maximum daily dose permitted was 800 mg for the tablet and 400 mg for the oral suspension. The median duration of exposure was 1.8 months (1 day-29 months).

Results of this study did not show any meaningful anti-tumor activity in the respective pediatric population. Pazopanib is therefore not recommended for treatment of these tumors in the pediatric population (see section 4.2 for information on pediatric use).

The European Medicines Agency has waived the obligation to submit the results of studies with pazopanib in all subsets of the pediatric population in treatment of kidney and renal pelvis carcinoma (excluding nephroblastoma, nephroblastomatosis, clear cell sarcoma, mesoblastic nephroma, renal medullary carcinoma and rhabdoid tumor of the kidney) (see section 4.2 for information on pediatric use).

## 5.2 Pharmacokinetic properties

### General properties

#### Absorption:

Upon oral administration of a single pazopanib 800 mg dose to patients with solid tumors, maximum plasma concentration ( $C_{max}$ ) of approximately  $19 \pm 13$  microgram/mL was obtained after median 3.5 hours (range 1.0-11.9 hours) and an  $AUC_{0-\infty}$  of approximately  $650 \pm 500$  microgram.hour/mL was obtained. Daily dosing results in 1.23- to 4-fold increase in  $AUC_{0-T}$ .

There was no consistent increase in AUC or  $C_{max}$  at pazopanib doses above 800 mg.

Systemic exposure to pazopanib is increased when administered with food. Administration of pazopanib with a high-fat or low-fat meal results in an approximately 2-fold increase in AUC and  $C_{max}$ . Therefore, pazopanib should be administered at least two hours after food or at least one hour before food (see section 4.2).

Administration of a pazopanib 400 mg crushed tablet increased  $AUC_{(0-72)}$  by 46% and  $C_{max}$  by approximately 2-fold and decreased  $t_{max}$  by approximately 2 hours compared to administration of the whole tablet. These results indicate that the bioavailability and the rate of pazopanib oral absorption are increased after administration of the crushed tablet relative to administration of the whole tablet (see section 4.2).

#### Distribution

Binding of pazopanib to human plasma protein *in vivo* was greater than 99% with no concentration dependence over the range of 10-100 microgram/mL. *In vitro* studies suggest that pazopanib is a substrate for P-gp and BCRP.

#### Biotransformation

Results from *in vitro* studies demonstrated that metabolism of pazopanib is mediated primarily by CYP3A4, with minor contributions from CYP1A2 and CYP2C8. The four principle pazopanib metabolites account for only 6% of the exposure in plasma. One of these metabolites inhibits the proliferation of VEGF-stimulated human umbilical vein endothelial cells with a similar potency to that of pazopanib, the others are 10- to 20-fold less active. Therefore, activity of pazopanib is mainly dependent on parent pazopanib exposure.

#### Elimination

Pazopanib is eliminated slowly with a mean half-life of 30.9 hours after administration of the recommended dose of 800 mg. Elimination is primarily via feces with renal elimination accounting for <4% of the administered dose.

### Characteristics in patients

#### *Renal impairment*

Results indicate that less than 4% of an orally administered pazopanib dose is excreted in the urine as pazopanib and metabolites. Results from population pharmacokinetic modelling (data from volunteers with baseline CLCR values ranging from 30.8 mL/min to 150 mL/min) indicated that renal impairment is unlikely to have clinically relevant effect on pazopanib pharmacokinetics. No dose adjustment is required in patients with creatinine clearance above 30 mL/min. Caution is advised in patients with creatinine clearance below 30 mL/min as there is no experience of pazopanib in this

patient population (see section 4.2).

*Hepatic impairment*

Mild:

The median steady-state pazopanib  $C_{max}$  and  $AUC_{(0-24)}$  in patients with mild abnormalities in hepatic parameters (defined as either normal bilirubin and any degree of ALT elevation or as an elevation of bilirubin up to 1.5 x ULN regardless of the ALT value) after administration of 800 mg once daily are similar to the median in patients with normal hepatic function (see Table 4). 800 mg pazopanib once daily is the recommended dose in patients with mild abnormalities of serum liver tests (see section 4.2).

Moderate:

The maximally tolerated pazopanib dose (MTD) in patients with moderate hepatic impairment (defined as an elevation of bilirubin >1.5 x to 3 x ULN regardless of the ALT values) was 200 mg once daily. The median steady-state  $C_{max}$  and  $AUC_{(0-24)}$  values after administration of 200 mg pazopanib once daily in patients with moderate hepatic impairment were approximately 44% and 39%, of the corresponding median values after administration of 800 mg once daily in patients with normal hepatic function, respectively (see Table 5).

Based on safety and tolerability data, the dose of pazopanib should be reduced to 200 mg once daily in subjects with moderate hepatic impairment (see section 4.2).

Severe:

The median steady-state  $C_{max}$  and  $AUC_{(0-24)}$  values after administration of 200 mg pazopanib once daily in patients with severe hepatic impairment were approximately 18% and 15%, of the corresponding median values after administration of 800 mg once daily in patients with normal hepatic function. Based on the diminished exposure and limited hepatic reserve pazopanib is not recommended in patients with severe hepatic impairment (defined as total bilirubin >3 X ULN regardless of any level of ALT) (see section 4.2).

**Table 7. Median steady-state pazopanib pharmacokinetics measured in subjects with hepatic impairment.**

Group	Investigated dose	$C_{max}$ (microgram/mL)	$AUC_{(0-24)}$ (microgram x hour/mL)	Recommended dose
<b>Normal Hepatic Function</b>	800 mg OD	52.0 (17.1-85.7)	888.2 (345.5-1482)	800 mg OD
<b>Mild Hepatic Impairment</b>	800 mg OD	33.5 (11.3-104.2)	774.2 (214.7-2034.4)	800 mg OD
<b>Moderate Hepatic Impairment</b>	200 mg OD	22.2 (4.2-32.9)	256.8 (65.7-487.7)	200 mg OD
<b>Severe Hepatic Impairment</b>	200 mg OD	9.4 (2.4-24.3)	130.6 (46.9-473.2)	Not recommended

OD – once daily

Pediatric population

Upon administration of pazopanib 225 mg/m<sup>2</sup> (as oral suspension) in pediatric patients, the pharmacokinetic parameters (C<sub>max</sub>, T<sub>max</sub> and AUC) were similar to those previously reported in adult patients treated with 800 mg pazopanib. Results indicated no marked difference in the clearance of pazopanib, normalized by body surface area, between children and adults.

### 5.3. Preclinical safety data

The preclinical safety profile of pazopanib was assessed in mice, rats, rabbits and monkeys. In repeat dose studies in rodents, effects in a variety of tissues (bone, teeth, nail beds, reproductive organs, hematological tissues, kidney and pancreas) appear related to the pharmacology of VEGFR inhibition and/or disruption of VEGF signaling pathways, with most effects occurring at plasma exposure levels below those observed in the clinic. Other observed effects include bodyweight loss, diarrhea and/or morbidity that were either secondary to local gastrointestinal effects caused by high local mucosal medicinal product exposure (monkeys) or pharmacological effects (rodents). Proliferative hepatic lesions (eosinophilic foci and adenoma) were seen in female mice at exposures 2.5 times human exposure based on AUC.

In juvenile toxicity studies, when pre-weaning rats were dosed from day 9 post-partum through to day 14 post-partum, pazopanib caused mortalities and abnormal organ growth/maturation in kidney, lung, liver and heart, at a dose approximately 0.1 times the clinical exposure based on AUC in adult humans. When post-weaning rats were dosed from day 21 post-partum to day 62 post-partum, toxicological findings were similar to adult rats at comparable exposures. Human pediatric patients are at increased risk for bone and teeth effects as compared to adults, as these changes, including inhibition of growth (shortened limbs), fragile bones and remodeling of teeth, were present in juvenile rats at  $\geq 10$  mg/kg/day (equal to approximately 0.1-0.2 times the clinical exposure based on AUC in adult humans) (see section 4.4).

#### Reproductive, fertility and teratogenic effects

Pazopanib has been shown to be embryotoxic and teratogenic when administered to rats and rabbits at exposures more than 300-fold lower than the human exposure (based on AUC). Effects included reduced female fertility, increased pre- and post-implantation loss, early resorptions, embryoletality, decreased fetal body weight and cardiovascular malformation. Decreased corpora lutea, increased cysts and ovarian atrophy have also been noted in rodents. In a rat male fertility study, there was no effect on mating or fertility, but decreased testicular and epididymal weights were noted with reductions in sperm production rates, sperm motility, and epididymal and testicular sperm concentrations observed at exposures 0.3 times human exposure based on AUC.

#### Genotoxicity

Pazopanib did not cause genetic damage when tested in genotoxicity assays (Ames assay, human peripheral lymphocyte chromosome aberration assay and rat *in vivo* micronucleus). A synthetic intermediate in manufacture of pazopanib, which is also present in the final drug substance in low amounts, was not mutagenic in the Ames assay but genotoxic in the mouse lymphoma assay and *in vivo* mouse micronucleus assay.

#### Carcinogenicity

In two-year carcinogenicity studies with pazopanib, there were increased numbers of liver adenomas noted in mice and duodenal adenocarcinomas noted in rats. Based on the rodent-specific pathogenesis and mechanism for these findings, they are not considered to represent an increased carcinogenic risk for patients taking pazopanib.

## 6. PHARMACEUTICAL PARTICULARS

### 6.1 List of excipients

#### *Tablet Core*

Microcrystalline cellulose, Type 102  
Sodium starch glycolate, Type A  
Povidone, K30  
Magnesium stearate

#### *Film-coating:*

#### Opadry White® YS-1-7706-G

Titanium Dioxide (E171)  
Hypromellose 2910 (6 cps)  
Hypromellose 2910 (3 cps)  
Macrogol  
Polysorbate 80

### 6.2 Incompatibilities

Not applicable.

### 6.3 Shelf life

24 months

### 6.4 Special precautions for storage

Store at room temperature below 30°C.

### 6.5 Nature and contents of container

Our product is primarily packaged in PVC/Aclar and aluminum foil blister packs. Blisters are packaged in cardboard boxes. Each box contains 60 tablets and is presented in blister packs with package leaflet.

### 6.6 Special precautions for disposal and other handling

Any unused product or waste material should be disposed of in accordance with local requirements.
